

SWEGON CASA GENIUS R

Intelligent residential
ventilation unit with
rotary heat exchanger

Swegon

Swegon CASA

Quality indoor air is the key to a healthy home

Intelligent ventilation system monitors air quality in the living space and ventilation automatically according to tenants' needs. It saves energy and guarantees healthy indoor air automatically under all conditions.

Healthy indoor air

The ventilation removes the stale air and replaces it with fresh, cleaned and filtered air, so that the indoor air at home is always pleasant and healthy to breathe.

Prevents moisture problems

The ventilation removes excess humidity to prevent moisture problems and mold. Uncontrolled pressure differences can transfer moisture into structures. A well-balanced ventilation system can handle pressure balance, even in cold conditions, and with a wood burning stove!

The lowest noise level on the market

Swegon CASA units have been tested to have the lowest noise level on the market.

Saves energy

An energy-efficient ventilation system does not waste heat energy, but instead transforms it into free heating. The heat is recovered from dirty return air and transferred into incoming fresh supply air.

Performance Rated

Swegon CASA airflow and recovery ratings are certified by HVI, Home Ventilation Institute.

UL and PHI certified

The certification guarantees that units have been tested and verified for North America and Passive House.

Swegon CASA R5 installed in
a closet behind a sliding door

Swegon CASA Genius

Intelligent control of the ventilation

Using the Swegon CASA Genius control system, residents can monitor the quality of the indoor air (RH, CO₂, VOC, F), control the ventilation according to need or allow the intelligent control to regulate the ventilation automatically.

Swegon CASA control panel

Wall-mounted touch screen for external or flush mounting. From the touch screen, it is possible to monitor ventilation, change the ventilation's operating mode, change the equipment's settings and commission the ventilation unit. The screen can be connected to the home's WLAN network, enabling the ventilation to be controlled remotely from a mobile app.

The Swegon CASA app

Using this app, the home owner can use all the functions in the control panel remotely from their own smartphone. With the aid of the app, the user has access to more information about their home's air quality as well as valuable instructions and advice about the ventilation (needs Swegon Genius control panel).

The CASA Service app

App for installation engineers/service engineers, which provides assistance when commissioning the ventilation unit. The app works locally together with the ventilation unit and does not require connection to a network. For example, the app defines the I/O connections, presets the percentage values for the fan speeds that correspond to specified air volumes, as well as automatically setting air volumes for home and boost mode. Finished settings can be saved in the app and copied to the next home (needs Swegon Genius control panel).

Home automation

Can be connected to the home automation for centralised monitoring and control, either directly via configurable I/O or with the aid of a separate Modbus connection module (SEM).

BACnet router

Can be connected to BAC building automation network with a separate BACnet router.

Flat touch screen

Mobile app

Available on the
App Store

Basic modes

You can switch as required to an appropriate operating mode or let the pre-programmed weekly clock switch operating mode according to the diurnal rhythm you want.

Home

Normal air flow. Sufficient amount of fresh indoor air to ensure the wellbeing of the residents and the structural building elements when there are people in the home.

Home+

Higher air flow. Can be used when more ventilation is required. The home owner can change the efficiency of the operating mode from the settings.

Boost

High air flow. Used if the ventilation requirement increases, for example, when cooking, taking a bath or drying laundry, or when an unusually large number of people are in the home.

Away

Low air flow. Reduces the energy consumption when nobody is present in the home.

Travelling

Very low air flow and lower supply air temperature. Used when nobody is present in the home.

Automatic functions

The intelligent ventilation monitors the quality of the indoor air and adjusts the ventilation automatically.

RH Humidity

35%

Automatic RH system included as standard

The intelligent control analyses the indoor air continuously and regulates the ventilation steplessly so that the set point humidity is maintained.

CO₂ Carbon dioxide

520 PPM

Automatic CO2 system as optional equipment

Automatically lowers the ventilation and saves energy when nobody is in the home. When the residents are at home, the ventilation is automatically boosted to bring exactly the right amount of fresh air into the home.

VOC Air quality

950 PPM

Automatic VOC system as optional equipment

The automatic air quality system boosts the ventilation if pollution, odours or vapours (evaporating organic compounds) are detected in the indoor air.

suspended ceiling

R-Series

Air handling units with rotary heat exchanger

Energy saving

Swegon CASA ventilation units with rotary heat exchangers boast a very high level of efficiency (up to 86%). When the stale indoor air is removed from the home, the thermal and latent energy is utilized and the fresh outdoor air that flows in is heated up by the residual heat energy. During the heating season, the ventilation unit creates “free” heating energy equivalent to up to 36°C (97F), by heating -20°C (-4F) outdoor air to +16°C (61F) supply air without using any auxiliary pre or post heating energy sources. A rotary enthalpy exchanger also recovers some of the moisture to the supply air. This is an advantage, particularly in the winter, when excessively dry indoor air can cause problems for the home and the residents. During the cooling season, the ventilation unit works as the first stage of cooling and dehumidification using the rotary enthalpy exchanger.

Balanced ventilation

Modern homes are built to be energy-efficient and simultaneously airtight. However, large pressure differences can cause a risk of moisture in the building's structures and give rise to everyday problems. Intelligent compensating features strive to balance the house's ventilation to prevent harmful pressure differences.

Frost protection

The defrost function ensures continuous ventilation, even in cold conditions. If there is a risk of the heat exchanger in the unit freezing, the speed of the rotor is changed and the heated return air prevents freezing inside the heat exchanger. With the aid of preheating (optional equipment), balanced ventilation can be maintained and the occurrence of excessive negative pressure can be prevented, even in the case of extreme cold.

Reheating (optional equipment)

The return air's heating energy is usually sufficient to heat up the supply air. In extreme cold conditions, it is possible to use an electric or hydronic coil for reheating. The air heater for reheating must be placed external in the ventilation duct (see technical brochure).

Preheating (optional equipment)

Using a preheater, hydronic or electric coil, is recommended at ambient temperature lower than -25°C (-13°F) to prevent frost formation on heat exchanger. The air heater for preheating must be placed external in the ventilation duct (see technical brochure).

Summer functions

An intelligent summer function automatically regulates the ventilation to keep the temperature in the home at a pleasant level. At night, the air passes the heat exchanger and the home is cooled with fresh outdoor air. On warm and humid days, the heat exchanger utilizes the cool and drier indoor air to cool down the warmer incoming air. This is all managed by an advanced automatic system that can be set according to the resident's requirements. By making smart use of the temperature and absolute humidity differences and the enthalpy exchanger, increases in the indoor temperature and humidity can be prevented or delayed economically.

Cooling

If there is a chilled water circuit (e.g. ground cooling) in the building, a separate coil can be supplied as optional equipment and be installed in the supply/return air duct to produce efficient cooling in the home. The ventilation unit's control system controls the supply air temperature automatically.

R-Series

1. Supply air
2. Return air
3. Outdoor air
4. Exhaust air

- 25-80 l/s | 53 - 169 cfm
- ERV
- Energy class A* / Sound level 39 dB
- Temperature efficiency 86 % (EN 13141-7)
- Automatic rotor speed control for demand-controlled humidity function
- Wall or ceiling mounting

- 20-92 l/s | 42 - 194 cfm
- ERV
- Energy class A* / Sound level 39 dB
- Temperature efficiency 82 % (EN 13141-7)
- Automatic rotor speed control for demand-controlled humidity function
- Low installation height (296 mm - 11.6 in.) allows ceiling installation flush in suspended ceilings
- Can also be mounted on a wall or the floor
- Vertical mounting only with R4-C Enthalpy (ERV) unit

- 35-120 l/s | 75 - 254 cfm
- ERV
- Energy class A* / Sound level 37 dB
- Temperature efficiency 86 % (EN 13141-7)
- Automatic rotor speed control for demand-controlled humidity function
- Wall or ceiling mounting
- PHI sensible and humidity efficiency +80%

*Energy classification according to EcoDesign directive Lot 6. Energy class may vary depending on the selected accessories.

Carbon footprint

Ventilation is an environmental act

An intelligent ventilation system helps to reduce your home's environmental load. CASA ventilation units save energy and the environment many times over in relation to their carbon load. For an environmentally aware builder, an intelligent ventilation unit guarantees the green targets that have been laid down for a housing project.

The ventilation's impact on the environment

Swegon CASA is the first ventilation unit to have been awarded a certified environmental product declaration (EPD) and life cycle assessments (LCA).

This means that the carbon footprint throughout the ventilation unit's life cycle has been calculated by official bodies. These calculations include the raw materials that have been used in the production process, manufacturing, transport, energy consumption over 25 years of operation, as well as the environmental load during the recycling phase.

In practice, the ventilation unit's carbon footprint is in the same class as normal household appliances. Unlike other household appliances, however, the ventilation unit does not only cause carbon emissions. Thanks to its energy savings, the environmental benefits achieved by the ventilation unit are many times greater than its negative effects.

The reduction in carbon emissions resulting from the energy savings exceed the carbon emissions caused by the manufacturing process in well under a year, after which the ventilation unit reduces the entire building's carbon emissions for the next 25 years.
